INTRODUCTION

This analysis was conducted in order to assess the traffic impact of the proposed expansion to the Seminole Science School in Seminole County, Florida. The expansion site is located in the northwest corner of the intersection of US 17-92 and Ronald Reagan Boulevard adjacent to the existing school. The existing school has 535 K–8 students and will be expanded to a total enrollment of 1,440 K–12 students. **Figure 1** depicts the site location of the existing and expanded school. Access to the site will be provided via the same access connections as the existing school plus a new right-in/right-out driveway on Ronald Reagan Boulevard. **Figure 2** depicts the conceptual site plan of the school expansion.

The project is in the Seminole County Dense Urban Land Use Area (DULA). As per Seminole County requirements, the classified roadways within the one-mile sphere of influence (or impact area) and major intersections within a quarter mile from the site were included in the traffic analysis. The analysis was conducted in accordance with a study methodology submitted to and reviewed by Seminole County. The study methodology and related correspondence are included in **Appendix A**. Data used in the analysis consisted of site plan and development information provided by the Project Engineers, daily traffic volume data obtained from Seminole County, and A.M./P.M. peak hour intersection counts made by Traffic Planning and Design, Inc. (TPD) personnel.

Site Plan

EXISTING TRAFFIC CONDITIONS

Existing traffic conditions were analyzed using daily traffic volumes for the study roadways and A.M./P.M. peak hour traffic volumes for the study intersections. The roadway analysis consisted of a generalized capacity analysis with the existing traffic volumes and the available capacity. The intersection analysis was conducted using *Synchro* software. Pertinent roadway segment data sheets showing the existing and committed trips along with the corresponding segment capacities are included in **Appendix B**.

Existing 2024 Roadway Capacity Analysis

A roadway segment analysis was performed for the study roadway segments by comparing the total daily traffic volume of each segment with the corresponding capacity of the segment. **Table 1** shows the roadway segments along with their number of lanes, adopted daily capacities, existing traffic volumes, available capacities, and existing Levels of Service (LOS). The results of the analysis indicate that the roadway segments currently operate satisfactorily with excess traffic capacity available.

Table 1

043	Continental Blvd to CR 427	2U	19,360	11,000	8,360	A

Existing 2023 Intersection Capacity Analysis

Capacity analysis was conducted for the existing A.M. and P.M. peak hour traffic conditions for the study intersections. The analysis was conducted utilizing *Synchro* software using the existing peak hour traffic volumes, intersection geometry, and signal timing data. The turning movement counts were made on September 19th, 2023, when the FDOT seasonal factor for Seminole County was 1.10, and therefore the counts were adjusted by this factor. The adjusted peak hour traffic volumes used in the analysis are shown in **Figures 3a** and **3b**. The turning movement counts, signal timing data, and FDOT seasonal factor report are included in **Appendix C**. The intersection capacity analysis results are summarized in **Table 2**, which indicates that the study intersections are currently operating at overall satisfactory Levels of Service. The intersections of US 17-92 with Weldon Boulevard and US 17-92 with Ronald Reagan Boulevard are operating with failing minor approaches due to the long cycle length used for signals on US 17-92 and the high volumes of existing traffic on US 17-92. Detailed capacity analysis worksheets are included in **Appendix D**.

Seminole Science School Expansion
Project № 5834
Figure 3a

**Existing A.M. Peak
Hour Volumes**

PROPOSED DEVELOPMENT AND TRIP GENERATION

The proposed development will expand Seminole Science School to K–12 with a total of 1,440 students. To determine the impact of this development in the area, an analysis of its trip generation characteristics was made. This included the determination of the trips to be generated and the distribution/ assignment of these trips to the area roadways.

Trip Generation

The trip generation of the proposed development was calculated using data obtained from the 11th Edition of the *Institute of Transportation Engineers (ITE) Trip Generation Manual*. The results of the trip generation calculation are summarized in **Table 3** and ITE trip generation sheets are included in the Study Methodology. As shown in the table, the proposed development will generate 1,382 daily trips, of which 601 will occur during the A.M. peak hour and 444 during the P.M. peak hour. With the proposed expansion, 470 students (K - 5th) will attend the existing school and 970 students (6th – 12th) will attend the new school.

Table 3
Trip Generation Summary

ITE Code	Land Use	Size	Daily		A.M. Peak Hour				P.M. Peak Hour			
			Rate	Trips	Rate	Enter	Exit	Total	Rate	Enter	Exit	Total
Existing School												
530	Private Charter School (K–8)	535 Students	4.11	2,199	1.01	303	237	540	0.60	151	170	321
Expanded School												
532	Private Charter School (K–12)	1,440 Students	2.48	3,581	0.79	719	422	1,141	0.53	321	444	765
Trip Increase (+)/Decrease (-) Due to Expansion				+1,382	---	+416	+185	+601	---	+170	+274	+444

Trip Distribution and Assignment

A distribution pattern for the proposed development trips was determined with the use of the 2030 Central Florida Regional Planning Model (CFRPM). **Figure 4** depicts the trip distribution pattern in the project vicinity for the site. The project trips will be assigned to the area roadways based on this distribution. The model distribution plot is included in the study methodology.

PROJECTED TRAFFIC CONDITIONS

Projected traffic conditions were analyzed using daily traffic volumes for the study roadways and A.M./P.M. peak hour traffic volumes for the study intersections and access driveways. The roadway analysis consisted of a generalized capacity analysis with the projected traffic consisting of background traffic and project trips. Background traffic consists of existing traffic combined with the committed trips provided by Seminole County, which are included in Appendix B. The project is anticipated to be completed by the end of 2029.

Projected 2029 Roadway Capacity Analysis

A roadway segment analysis was performed for the study roadway segments by comparing the total projected daily traffic volume of each segment with the corresponding capacity of the segment. The roadway segment analysis is summarized in **Table 4**. The table shows each of the road segments along with their total projected traffic volumes and resultant Levels of Service. The results of the analysis indicate that the impacted road segments are projected to continue to operate at satisfactory Levels of Service with the committed trips and project trips added.

Table 4

* Highest on Segment

Projected 2029 Intersection Capacity Analysis

The peak hour traffic conditions at the study intersections were estimated by adding the project trips to existing traffic and committed trips. Daily committed trips were converted to peak hour directional trips using a K=0.09 factor and a D=0.55 factor. These trips were assigned to the intersections based upon the existing traffic patterns at the study intersections. The projected A.M. and P.M. peak hour traffic volumes used in the analysis are shown in **Figures 5a, 5b, and 5c.**

An analysis of projected peak hour traffic conditions was performed using *Synchro* software, similar to the existing conditions analysis. The results of the capacity analysis, as summarized in **Table 5**, indicate the study intersections and site access driveways will continue to operate at overall satisfactory Levels of Service (LOS E or better) upon the addition of the project trips. However, similar to existing conditions, the intersections of US 17-92 with Ronald Reagan Boulevard and Weldon Boulevard are projected to fail for the minor street approaches. In the analysis, the operation of US 17-92 and Ronald Reagan Boulevard was optimized. Additionally, the EB/WB approaches of the School Driveway on Weldon Boulevard will fail during the A.M. peak hour. The v/c ratio for these approaches is less than 1.00, indicating the failing Level of Service is caused by the stop-control at the intersection and not a capacity deficiency. The detailed capacity worksheets are included in **Appendix E.**

Table 5
Projected 2029 Intersection Capacity Analysis

Intersection	Control	Time Period	EB		WB		NB		SB		Overall

Turn Lane Analysis

Access to the expanded school site is proposed via the existing driveways serving the existing school, as well as a proposed right-in/right-out driveway on Ronald Reagan Boulevard. There is an existing auxiliary right turn lane which serves the site access driveway on US 17-92. A turn lane analysis was conducted to determine the need for an auxiliary right turn lane on Ronald Reagan Boulevard. The analysis was conducted according to the procedures of the Seminole County Public Works Engineering Manual. According to section 1.3 of the manual, auxiliary right turn lanes are required on 4 lane roadways for projects with a daily trip generation of more than 4,000 trips. The total daily trip generation for the proposed expansion is 1,382 trips, therefore an auxiliary right turn lane is not required to serve the project access on Ronald Reagan Boulevard. Excerpts from the Engineering Manual are included in **Appendix F**.

On-Site Queueing

A review of the site plan was conducted with respect to internal site circulation and queueing. The new school building will be accessed from the east via the existing access driveways from US 17-92 and Weldon Boulevard. An additional right-in/out access will be provided on Ronald Reagan Boulevard.

In terms of queueing, the proposed site plan is expected to operate well due to the significant amount of on-site queue storage provided. During the critical peak morning drop-off period, single lane storage will be available for on-site queueing with a total distance of approximately 4,469 feet (see **Figure 6**). Assuming the average vehicle length of 25 feet, the site provides storage for 179 regular vehicles at any one time.

The Seminole Science School will have a total enrollment of 1,440 students with 970 students accommodated at the new school building on Ronald Reagan Boulevard. For queueing purposes, the 970 student enrollment at the new school building would represent the highest number of students to be accommodated during drop-off and pick up periods.

Seminole Science School Expansion
Project № 5834
Figure 6

Queue Length

An approximate average queue length was estimated using Little's Law, which states that the average queue length equals the average arrival rate times the average wait time. Assuming that all of the 970 students at the new school building arrive in the A.M. period in a 30-minute window and each vehicle takes 8-10 minutes to drop off a child, the average queue length was determined to be 161 vehicles (as indicated below) which can be accommodated by the on-site queue provided as per the site plan.

Queue Determination:

New School Building – 970 students, A.M. peak hour trips entering = $970 \times 0.79 \times 0.63 = 483$

$$\begin{aligned} \text{Average Queue Length (veh)} &= \text{Average Arrival Rate (vpm)} \times \text{Average Drop-off Time (min)} \\ &= (483 \text{ veh}/30 \text{ mins}) \times 10 \text{ min (assumed)} \\ &= 161 \text{ vehicles} \end{aligned}$$

The site plan provides a total queue length for 179 vehicles.

At the request of the County, Synchro analysis was conducted to ensure that the queues formed at the internal conflict points at Site Access #1 and #2 do not spill out onto US 17-92 or Ronald Reagan Boulevard. The analysis was performed using the A.M. and P.M. peak hour volumes and the internal lane configuration depicted in Figure 6. The results of the analysis are summarized below in **Table 6**. As can be seen from the table, the internal conflict points at Site Access #1 and #2 will generate queue lengths less than 1 vehicle for the approaches entering the site. Therefore, internal queues will not spill out onto US 17-92 or Ronald Reagan Boulevard at Site Access #1 or #2 during the drop-off/pick-up times. The detailed Synchro analysis worksheets are included in **Appendix G**.

Table 6
Queue Length Analysis

Internal Conflict Point	Time Period	Queue Length for Entering Approach
Site Access #1	A.M.	0.2 vehicles
	P.M.	0.1 vehicles
Site Access #2	A.M.	0 vehicles
	P.M.	0 vehicles

CONCLUSIONS

This analysis was undertaken in order to assess the traffic impact of the proposed expansion of the Seminole Science School in Seminole County, Florida. The school is located in the northwest corner of the intersection of US 17-92 and Ronald Reagan Boulevard and will be expanded on an adjacent site by 1,440 students (K–12). The results of the analysis as documented herein are summarized as follows:

- The proposed expansion will generate 1,382 additional daily trips, of which 601 trips will occur during the A.M. peak hour and 444 during the P.M. peak hour.
- Roadway capacity analysis revealed that the impacted roadway segments currently operate satisfactorily within their adopted LOS standards and will continue to do so upon the addition of the project trips.
- The intersection capacity analysis revealed that the study intersections currently operate at overall satisfactory Levels of Service (LOS E or better) and will continue to do so upon the addition of the committed trips and project trips. However, the intersections of US 17-92 with Ronald Reagan Boulevard and Weldon Boulevard will have failing minor street approaches. The signal timings for US 17-92 and Ronald Reagan Boulevard will have to be optimized to attain satisfactory Levels of Service.
- Access to the site is proposed via the existing driveways to the existing school plus a proposed right-in/right-out driveway on Ronald Reagan Boulevard. The site access driveways are projected to operate satisfactorily upon the addition of the project trips, except for the driveway on Weldon Boulevard. The EB/WB approaches of this intersection will fail during the A.M. peak hour; however, the v/c ratio for these approaches are under 1.00, indicating the failing Levels of Service are caused by the existing stop control at the intersection, and not a capacity-deficiency. Turn lane analysis determined an auxiliary right turn lane is not required at the site access driveway on Ronald Reagan Boulevard as per County guidelines.

Hi Rita,

I have confirmed that the requested changes have been made, satisfactorily. Use this version of the TIS Methodology as the approved document to prepare the TIS Report. I do have one question because schools are not in session right now. Are you going to take TMCs now or wait for schools to start the year on August 12th?

Let me know if you have any questions.

Regards,

Arturo

Subject: RE: TPD#5834 Seminole Science School Expansion

Hi Rita,

Per our telephone conversation earlier today, I am sending this email to confirm that the methodology was reviewed and approved by.

Go ahead and prepare the TIS.

Enjoy your weekend!

Regards,

Arturo

Good afternoon Arturo,

Attached please find our proposed study methodology for Seminole Science Charter School Expansion .

Please review and let us know if you have any questions or comments.

Thank you.

Regards,

MEMORANDUM

TO: Arturo J. Perez, P.E.

FROM: Turgut Dervish, P.E.

DATE: July 28, 2023

RE: **Traffic Impact Study Methodology**
Seminole Science School Expansion
TPD No. 5834

The following is an outline of the proposed methodology for the Traffic Impact Study for the proposed charter school in Seminole County, Florida. The project site is located in the SE corner of northwest corner of US 17-92 and Ronald Reagan Boulevard. **Figure 1** depicts the site location and the area roadways.

1. Proposed Development

The proposed development will consist of a school expansion for up to 1,000 students. Access to the site is proposed via access connections from US 17-92 and Ronald Reagan Boulevard. **Figure 2** depicts the conceptual site plan.

2. Trip Generation

Trip generation data from the 11th Edition of the Institute of Transportation Engineers (ITE) *Trip Generation Manual* will be used for the trip generation estimation of the development. **Table 1** provides a summary of the trip generation calculation. ITE Trip Generation sheets are attached.

Table 1
Trip Generation Calculation Summary

ITE Code	Land Use	Size	Daily		A.M. Peak Hour of Adjacent Street				P.M. Peak Hour of Generator			
			Rate	Trips	Rate	Enter	Exit	Total	Rate	Enter	Exit	Total
538	Charter School (K-12)	1,000 Students	2.48*	2,480	0.83	423	407	830	0.73	365	365	730
Total Trips				2,480	---	423	407	830	---	365	365	730

*Daily rate not available. ITE Code 532 Private School (K-12) Used.

Project № 5834
Figure 1

Site Location

Seminole Science School Expansion
 Project № 5834
 Figure 2

Site Plan

3. Trip Distribution

A distribution pattern was documented with the use of the CFRPM (v.7). The model was run with a select zone analysis which produced a distribution pattern for the project as shown in **Figure 3**. This distribution will be used to assign the project trips to the area roadways. The model distribution plots are included in the Attachment.

4. Impact Area

As per Seminole County TIA guidelines, major roadways within a one-mile radius and intersections with a quarter mile will be included in the analysis.

The intersections to be included in the area analysis are:

- 17-92 and Weldon Boulevard
- 17-92 and Ronald Reagan Boulevard
- 17-92 and SR 419/Silkwood Court
- Ronald Reagan Boulevard and Silkwood Court
- Site Entrances

The one mile and quarter mile areas and study intersections are depicted in **Figure 4**.

5. Traffic Impact Assessment

a) Roadways

- Obtain background traffic volumes on the study roadway segments from Seminole County for use in the traffic analysis. A.M. Counts will be made from 7-9 A.M. and P.M. counts from 2-4 P.M.
- Combine project traffic with background traffic to obtain total traffic volumes.
- Perform daily roadway capacity analysis utilizing Seminole County standards.

Intersections

- Conduct intersection counts during the A.M. and P.M. peak periods at the study intersections.
- Determine background traffic by combining existing traffic counts with committed trips to be provided by the County.
- Combine project traffic with background traffic to obtain total traffic.
- Perform intersection capacity analysis utilizing the HCM/HCS operational analysis procedures for the P.M. peak hour.

7. Traffic Report

Prepare traffic report summarizing study procedures, analyses and recommendations. If you have any questions or concerns, please contact us at (407) 628-9955.

Intersection Notes

Intersection set up with split sides.
OL A & F are to double cycle NBLT

Intersection programmed in USER but runs as a QUADSEQ
Maintstreet LT's are protected and lock Det.
OL I is for the ph 8 RT.

T.O.D Notes

Intersection retimed May 2022.

Patterns 17 & 19 are FDOT SR 417 Diversion routes.
Patterns 23 - 25 used for FDOT flush patterns.
Patterns 27 to 29 used for FDOT I-4 diversion routes.

Intersection Notes

Intersection setup with concurrent sides
All LT's are protected and Lock Det
OL K I is programmed for 2R.

T.O.D Notes

Intersection retimed May 2022.

Patterns 17 and 19 are used for 417 Diversion routes.

Patters 23 - 25 used for flush routes.

Patterns 27 to 29 used for I-4 Diversion routes.

Intersection Summary

Area Type: Other

Cycle Length: 180

Actuated Cycle Length: 180

Offset: 100 (56%), Referenced to phase 6:NET, Start of Green

Natural Cycle: 145

Control Type: Actuated-Coordinated

Maximum v/c Ratio: 1.14

Intersection Signal Delay: 75.3

Intersection LOS: E

Intersection Capacity Utilization 102.3%

ICU Level of Service G

Analysis Period (min) 15

~ Volume exceeds capacity, queue is theoretically infinite.

Queue shown is maximum after two cycles.

95th percentile volume exceeds capacity, queue may be longer.

Queue shown is maximum after two cycles.

m Volume for 95th percentile queue is metered by upstream signal.

APPENDIX F

Seminole County Public Works Engineering Manual

- D. For developments that request more than one two-way driveway, based upon parcel size, projected trip generation of the site, amount of roadway frontage, and other appropriate design considerations, additional driveways may be permitted if all other requirements are met, as approved by the County Engineer.

1.2.8. Corner Clearance

- A. Parcels located in the corner of two or more roadways where at least one of the roads is a public facility must locate access drives no closer than 330 feet from the intersection. Access may be provided at 200 feet from the intersection, where approved by the County Engineer. (Detail T-1)
- B. If the corner parcel accesses one or more arterial or collector roadways, full access is limited to 660 feet from the intersection on the arterial or collector. A right-in/right-out is permitted at 330 feet from the intersection. (Detail T-1)

Sec. 1.3. Auxiliary Lanes (Right and Left Turn Lanes)

The purpose for the development of marginal access standards is to reduce conflict between driveway entrances and through traffic. One method of reducing conflict is to provide a refuge area where vehicles can leave the through traffic lanes, slow down and accomplish the turn. Auxiliary lanes, as defined below, provide that capability and consequently may be required. The following specifications should be regarded as minimal. Longer lanes may be required based upon the speed of the accessed roadway, the development's projected right and left turn volumes, or construction conflicts with existing drives, streets or roads.

1.3.1. Requirements

- A. The length of turn lanes must comply with FDOT standards.
- B. On 2-lane roadways a **right turn** lane section is required for developments with a daily trip rate of 3,000 ADT or greater. On 2-lane roadways with posted speeds of 40 mph, or greater, a **right turn** lane may be required as determined by the County Engineer. On 4- and 6-lane roadways, a right turn lane section is required for developments with a daily trip rate of 4,000 ADT and greater. In all cases, an inbound radius of 50 feet at development access is required. See Detail T-16 for design and markings specifications, unless otherwise directed by the County Engineer.
- C. A **left turn** lane section is required for any development that accesses a road classified Collector and above or has a posted speed of 35 mph or higher. When a left turn lane falls within 300 feet from an existing left turn lane terminus, then a total 36-foot section is required to eliminate weaving or "hour glass" sections. See Detail T-16 for design and markings specifications, unless otherwise directed by the County Engineer.

Sec. 1.4. Driveway Design

The FDOT Design Standards must be used for all driveway designs, unless otherwise directed by the County. (Detail T-3)

Sec. 1.5. Cross-Access and Joint Use Driveways

- 1.5.1. During the review of a project or as a condition of approval, an agreement between the property owner and the Board of County Commissioners for a joint-use drive or cross-access easement may be required. The intent is to connect adjacent properties in order to limit the number of access points and to constitute a joint and common means of access to adjacent properties. The
