

My patient, Donald J. Sammarco, is an 80 year old male that was diagnosed with Pulmonary Fibrosis 2 years ago and has been under my care since then. Even though he suffers from shortness of breath on walking and exercising, I have recommended that he gets as much exercise in the fresh air weather permitting as possible.

To accomplish this currently he is doing mild exercise on his porch. This protects him from the extremes of the sun and inclement weather. Being in a controlled environment he is able to use his Oxygen Generator Machine while exercising. These exercises along with the use of his Oxygen Generator have helped his breathing problems.

I recommend that he continue to do light exercises at his new home in The Springs in Longwood, In order to accomplish this it is imperative that he has a controlled environment within which to exercise that will keep him out of the elements yet in the fresh air, will give him shelter from the weather, and allow the use of his Oxygen Generator.
